# Describing Data: Graphical

---

Data Driven Healthcare

Module B

Prof. Paola Cerchiello – University of Pavia

# Lecture Goals (1 of 3)

**After completing this lecture, you should be able to:**

- Explain how decisions are often based on incomplete information
- Explain key definitions:
  - Population vs. Sample
  - Parameter vs. Statistic
  - Descriptive vs. Inferential Statistics
- Describe random sampling and systematic sampling
- Explain the difference between Descriptive and Inferential statistics

# Chapter Goals (2 of 3)

**After completing this lecture, you should be able to:**

- Identify types of data and levels of measurement
- Create and interpret graphs to describe categorical variables:
  - frequency distribution, bar chart, pie chart, Pareto diagram
- Create a line chart to describe time-series data
- Create and interpret graphs to describe numerical variables:
  - frequency distribution, histogram, ogive, stem-and-leaf display

# Chapter Goals (3 of 3)

**After completing this lecture, you should be able to:**

- Construct and interpret graphs to describe relationships between variables:
  - Scatter plot, cross table
- Describe appropriate and inappropriate ways to display data graphically

# Key Definitions

- A population is the collection of all items of interest or under investigation
  - $N$  represents the population size
- A sample is an observed subset of the population
  - $n$  represents the sample size
- A parameter is a specific characteristic of a population
- A statistic is a specific characteristic of a sample

# Population vs. Sample

Population

Values calculated using  
population data are  
called parameters

Sample

Values computed from  
sample data are called  
statistics

# Examples of Populations

- Names of all registered voters in the United States
- Incomes of all families living in Daytona Beach
- Annual returns of all stocks traded on the New York Stock Exchange
- Grade point averages of all the students in your university

# Random Sampling

Simple random sampling is a procedure in which

- each member of the population is chosen strictly by chance,
- each member of the population is equally likely to be chosen,
- every possible sample of  $n$  objects is equally likely to be chosen

The resulting sample is called a random sample

# Descriptive and Inferential Statistics

Two branches of statistics:

- Descriptive statistics
  - Graphical and numerical procedures to summarize and process data
- Inferential statistics
  - Using data to make predictions, forecasts, and estimates to assist decision making

# Descriptive Statistics

- Collect data
  - e.g., Medical Reports

Present data  
e.g., Tables and graphs

- Summarize data

– e.g., Sample mean = 
$$\frac{\sum X_i}{n}$$

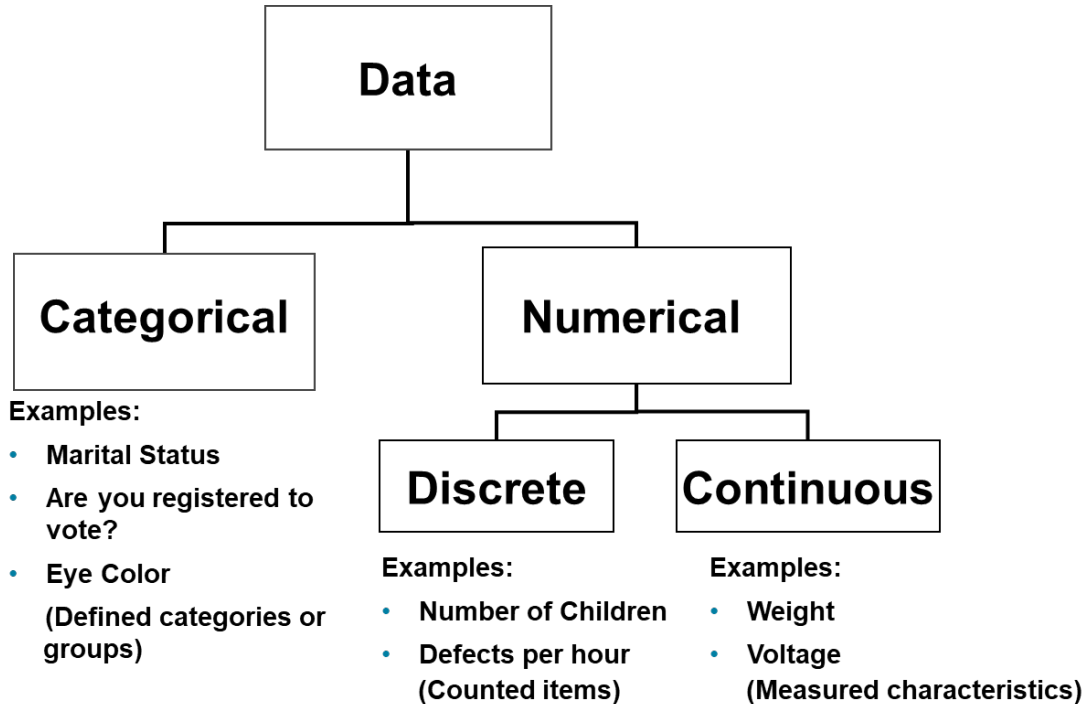

# Inferential Statistics

- Estimation
  - e.g., Estimate the population mean weight using the sample mean weight
- Hypothesis testing
  - e.g., Test the claim that the population mean weight is 140 pounds

**Inference is the process of drawing conclusions or making decisions about a population based on sample results**

# Classification of Variables

# eXplainable Artificial Intelligence in healthcare Management

2020-EU-IA-0098

# Measurement Levels

Differences between  
measurements, true  
zero exists

**Ratio Data**

Quantitative Data

Differences between  
measurements but no  
true zero

**Interval Data**

Ordered Categories  
(rankings, order, or  
scaling)

**Ordinal Data**

Qualitative Data

Categories (no  
ordering or direction)

**Nominal Data**

# Graphical Presentation of Data (1 of 2)

- Data in raw form are usually not easy to use for decision making
- Some type of organization is needed
  - Table
  - Graph
- The type of graph to use depends on the variable being summarized

# Graphical Presentation of Data (2 of 2)

- Techniques reviewed in this chapter:

## Categorical Variables

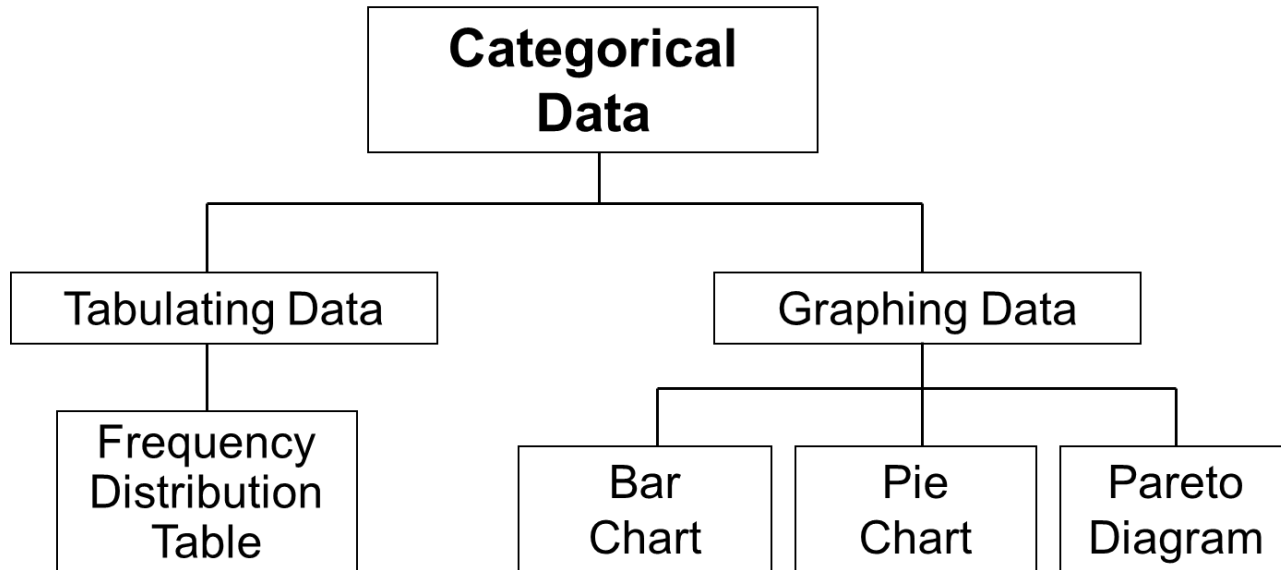

- Frequency distribution
- Cross table
- Bar chart
- Pie chart
- Pareto diagram

## Numerical Variables

- Line chart
- Frequency distribution
- Histogram and ogive
- Stem-and-leaf display
- Scatter plot

# Tables and Graphs for Categorical Variables

# The Frequency Distribution Table

Summarize data by category

Example: Hospital Patients by Unit

Hospital Unit	Number of Patients	Percent (rounded)
Cardiac Care	1,052	11.93
Emergency	2,245	25.46
Intensive Care	340	3.86
Maternity	552	6.26
Surgery	<u>4,630</u>	<u>52.50</u>
Total:	8,819	100.0

(Variables are  
categorical)

# Graph of Frequency Distribution

- Bar chart of patient data

# Cross Tables

- Cross Tables (or contingency tables) list the number of observations for every combination of values for two categorical or ordinal variables

If there are  $r$  categories for the first variable (rows)  
and  $c$  categories for the second variable (columns),

the table is called an  $r \times c$  cross table

# Cross Table Example

$3 \times 3$  Cross Table for Investment Choices by Investor  
(values in \$1000's)

<b>Investment Category</b>	<b>Investor A</b>	<b>Investor B</b>	<b>Investor C</b>	<b>Total</b>
Stocks	46	55	27	<b>128</b>
Bonds	32	44	19	<b>95</b>
Cash	15	20	33	<b>68</b>
<b>Total</b>	<b>93</b>	<b>119</b>	<b>79</b>	<b>291</b>

# Graphing Multivariate Categorical Data (1 of 2)

- Side by side horizontal bar chart

# Graphing Multivariate Categorical Data (2 of 2)

- Stacked bar chart

# Vertical Side-by-Side Chart Example

- Sales by quarter for three sales territories:

	1st Qtr	2nd Qtr	3rd Qtr	4th Qtr
<b>East</b>	20.4	27.4	59	20.4
<b>West</b>	30.6	38.6	34.6	31.6
<b>North</b>	45.9	46.9	45	43.9

# Bar and Pie Charts

- Bar charts and Pie charts are often used for qualitative (categorical) data
- Height of bar or size of pie slice shows the frequency or percentage for each category

# Bar Chart Example

Hospital Unit	Number of Patients
Cardiac Care	1,052
Emergency	2,245
Intensive Care	340
Maternity	552
Surgery	4,630

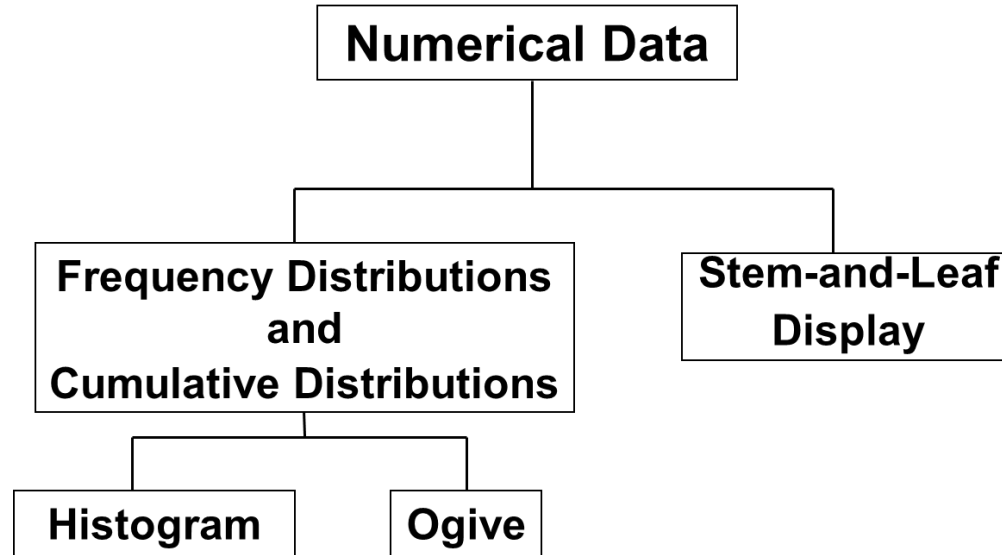

# Pie Chart Example

Hospital Unit	Number of Patients	% of Total
Cardiac Care	1,052	11.93
Emergency	2,245	25.46
Intensive Care	340	3.86
Maternity	552	6.26
Surgery	4,630	52.50

(Percentages  
are rounded to  
the nearest  
percent)

# Graphs to Describe Numerical Variables

# Frequency Distributions

What is a Frequency Distribution?

- A frequency distribution is a list or a table...
- containing class groupings (categories or ranges within which the data fall)...
- and the corresponding frequencies with which data fall within each class or category

## Why Use Frequency Distributions?

- A frequency distribution is a way to summarize data
- The distribution condenses the raw data into a more useful form...
- and allows for a quick visual interpretation of the data

# Class Intervals and Class Boundaries

- Each class grouping has the same width
- Determine the width of each interval by

$$w = \text{interval width} = \frac{\text{largest number} - \text{smallest number}}{\text{number of desired intervals}}$$

Use at least 5 but no more than 15-20 intervals

Intervals never overlap

Round up the interval width to get desirable interval endpoints

# Frequency Distribution Example (1 of 3)

Example: A manufacturer of insulation randomly selects 20 winter days and records the daily high temperature

data:

**24, 35, 17, 21, 24, 37, 26, 46, 58, 30,**  
**32, 13, 12, 38, 41, 43, 44, 27, 53, 27**

# Frequency Distribution Example (2 of 3)

- Sort raw data in ascending order:

12, 13, 17, 21, 24, 24, 26, 27, 27, 30, 32, 35, 37, 38, 41, 43, 44, 46, 53, 58

Find range:  $58 - 12 = 46$

Select number of classes: **5 (usually between 5 and 15)**

Compute interval width:  $10 \left( \frac{46}{5} \text{ then round up} \right)$

Determine interval boundaries: **10 but less than 20, 20 but**

**less than 30, ..., 60 but less than 70**

Count observations & assign to classes

# Frequency Distribution Example (3 of 3)

Data in ordered array:

**12, 13, 17, 21, 24, 24, 26, 27, 27, 30, 32, 35, 37, 38, 41, 43, 44, 46, 53, 58**

<b>Interval</b>	<b>Frequency</b>	<b>Relative Frequency</b>	<b>Percentage</b>
<b>10 but less than 20</b>	<b>3</b>	<b>.15</b>	<b>15</b>
<b>20 but less than 30</b>	<b>6</b>	<b>.30</b>	<b>30</b>
<b>30 but less than 40</b>	<b>5</b>	<b>.25</b>	<b>25</b>
<b>40 but less than 50</b>	<b>4</b>	<b>.20</b>	<b>20</b>
<b>50 but less than 60</b>	<b>2</b>	<b>.10</b>	<b>10</b>
<b>Total</b>	<b>20</b>	<b>1.00</b>	<b>100</b>

# Histogram

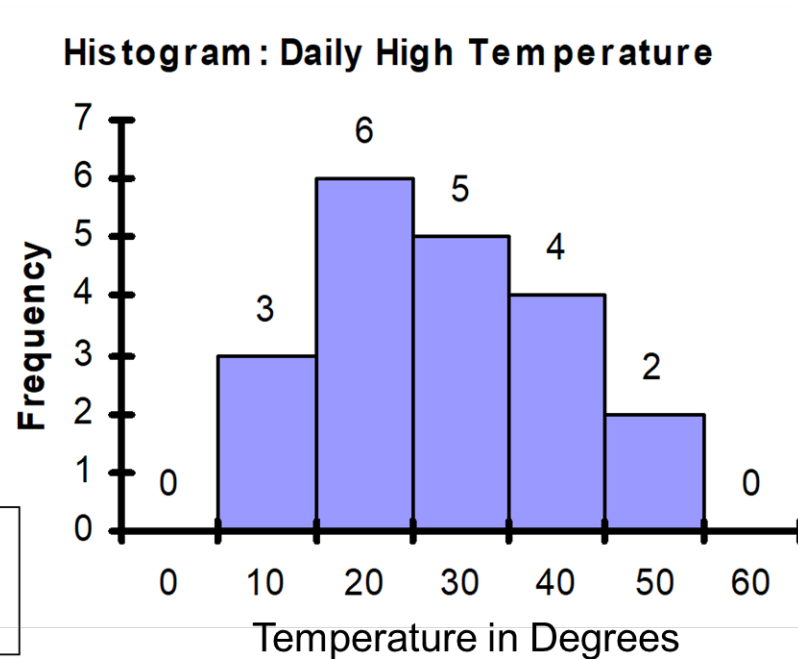

- A graph of the data in a frequency distribution is called a **histogram**
- The **interval endpoints** are shown on the horizontal axis
- the vertical axis is either **frequency, relative frequency, or percentage**
- Bars of the appropriate heights are used to represent the number of observations within each class

# Histogram Example

Interval	Frequency
10 but less than 20	3
20 but less than 30	6
30 but less than 40	5
40 but less than 50	4
50 but less than 60	2

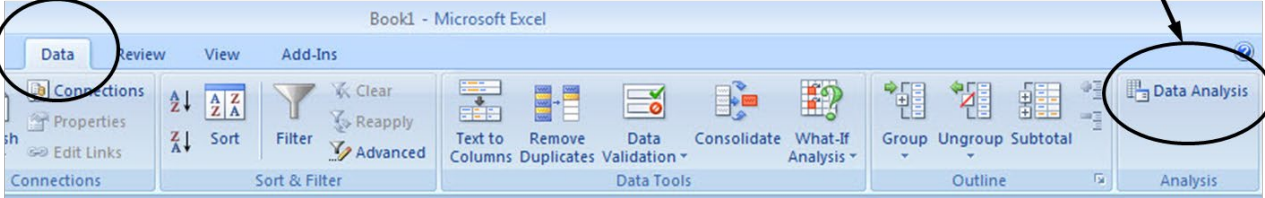

(No gaps  
between  
bars)

# Histograms in Excel (1 of 2)

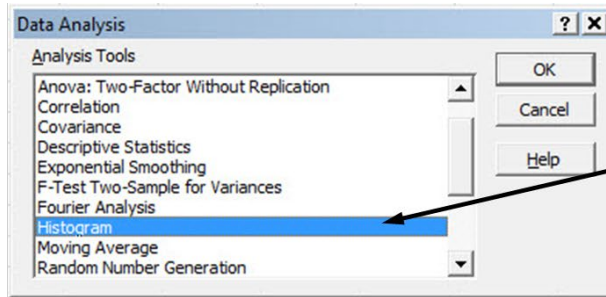

①  
Select **Data** Tab

②  
Click on **Data Analysis**

The screenshot shows the Microsoft Excel ribbon for 'Book1 - Microsoft Excel'. The 'Data' tab is selected and circled with a black circle and labeled with a circled '1'. An arrow points from the text 'Select Data Tab' to this circle. The 'Data Analysis' button in the 'Analysis' group is also circled with a black circle and labeled with a circled '2'. An arrow points from the text 'Click on Data Analysis' to this circle. The ribbon groups visible are 'Connections', 'Sort & Filter', 'Data Tools', 'Outline', and 'Analysis'.

# Histograms in Excel (2 of 2)

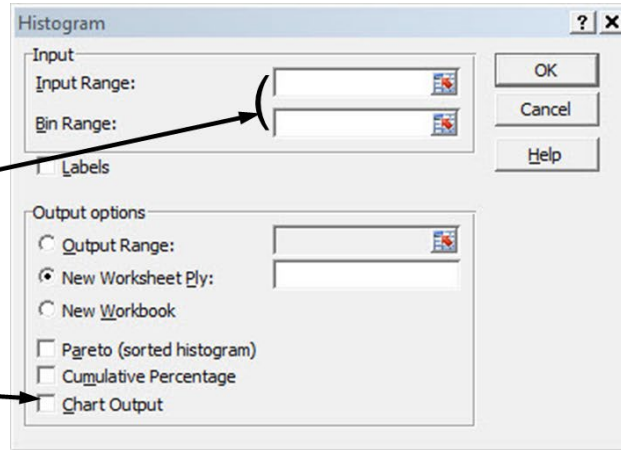

3

Choose Histogram

4

Input data range and bin range (bin range is a cell range containing the upper interval endpoints for each class grouping)

Select Chart Output and click "OK"

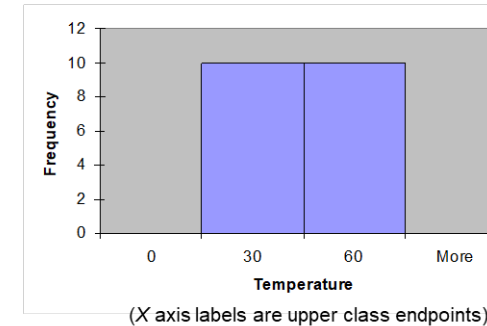

# Questions for Grouping Data into Intervals

- How wide should each interval be?  
(How many classes should be used?)
- How should the endpoints of the intervals be determined?
  - Often answered by trial and error, subject to user judgment
  - The goal is to create a distribution that is neither too "jagged" nor too "blocky"
  - Goal is to appropriately show the pattern of variation in the data

# How Many Class Intervals?

- **Many (Narrow class intervals)**
  - may yield a very jagged distribution with gaps from empty classes
  - Can give a poor indication of how frequency varies across classes
  
- **Few (Wide class intervals)**
  - may compress variation too much and yield a blocky distribution
  - can obscure important patterns of variation.

# The Cumulative Frequency Distribution

Data in ordered array:

12, 13, 17, 21, 24, 24, 26, 27, 27, 30, 32, 35, 37, 38, 41, 43, 44, 46, 53, 58

<b>Class</b>	<b>Frequenc y</b>	<b>Percentage</b>	<b>Cumulative Frequency</b>	<b>Cumulative Percentage</b>
10 but less than 20	3	15	3	15
20 but less than 30	6	30	9	45
30 but less than 40	5	25	14	70
40 but less than 50	4	20	18	90
50 but less than 60	2	10	20	100
<b>Total</b>	<b>20</b>	<b>100</b>		

# Scatter Diagrams

- Scatter Diagrams are used for paired observations taken from two numerical variables
- The Scatter Diagram:
  - one variable is measured on the vertical axis and the other variable is measured on the horizontal axis

# Scatter Diagram Example

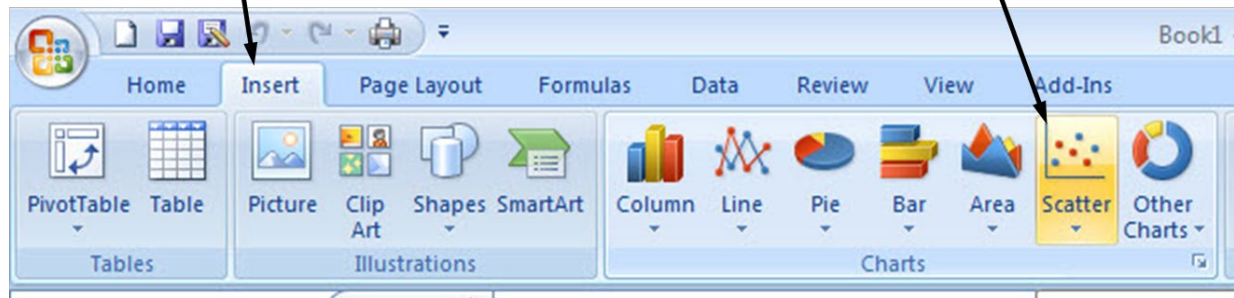

Average SAT scores by state: 1998		
	Verbal	Math
Alabama	562	558
Alaska	521	520
Arizona	525	528
Arkansas	568	555
California	497	516
Colorado	537	542
Connecticut	510	509
Delaware	501	493
D.C.	488	476
Florida	500	501
Georgia	486	482
Hawaii	483	513
...		
W.Va.	525	513
Wis.	581	594
Wyo.	548	546

# Scatter Diagrams in Excel

① Select the **Insert** tab

② Select **Scatter** type from  
the Charts section

③ When prompted, enter the data range, desired legend, and desired destination to complete the scatter diagram

# Data Presentation Errors (1 of 2)

Goals for effective data presentation:

- Present data to display essential information
- Communicate complex ideas clearly and accurately
- Avoid distortion that might convey the wrong message

## Data Presentation Errors (2 of 2)

- Unequal histogram interval widths
- Compressing or distorting the vertical axis
- Providing no zero point on the vertical axis
- Failing to provide a relative basis in comparing data between groups
